Medical Eye Exam (Examples: Ocular pain, bleeding, sudden vision loss, etc.)

\_\_\_\_\_ \$60-120 Office Visit (Determined by complexity and estimated amounts of follow-up examinations necessary)

\*There may be situations where the doctor must postpone the routine eye exam until the medical issue is resolved first\*

Explanation

\*\*\*Recommended every 1-2 years depending on age and presence of existing medical conditions\*\*\*

**Dilation** – The traditional method to examine the retina. Eye drops are used which dilate the pupils to view all the structures inside of the eyes. This process takes approximately 20-30 minutes. The side effects include blurry vision for 4-6 hours and light sensitivity. Depending on your prescription, **we usually recommend having a driver for this procedure.** This method is preferred if we need to have a more detailed view of the retina than what optomap imaging can provide.

**Optomap Imaging** – The modern-technology version of dilation. It is popular for the following reasons: it takes only 1-2 extra minutes in the exam vs. 20-30 extra minutes with the dilation, there are no side effects, and we are able to store the images for comparison in the future.

**OCT scan** – This technology allows us to examine the individual layers of the retina. Especially helpful in determining if decreased vision is due to pathology. The doctor will recommend this option *if necessary* for diagnosis or to rule out certain diseases or complications. (Only performed if medically necessary– additional \$10).

**\*\*Glasses and contact exams include follow-up visits free of charge for the first three months from original exam date\*\***

**Update only if has changed since your last visit**
